STATSPEC

On January 28, 1953, during the period from 13:40 (tune-in) to 14:00 GMT sign-off, the Vladivostok regional broadcast was observed on the new frequency of 8315 kcs. Observations of this frequency later showed it to be a spurious emission resulting from the combination of the Vladivostok regional transmitter RV77, at Voroshilov-Ussuriyskiy, on 380 kcs and a jamming signal on the Pusan frequency of 7935 kcs.

Continued observations on January 29th, during the period 12:00 to 14:00 GMT, disclosed the jammer being used on 7935 kcs identified itself with the morse characters "SG". In addition to the reported plus frequency combination of 8315 kcs, the companion minus combination was observed on 7555 kcs, indicating that the 380 kcs transmitter was in sufficiently close proximity to the 7935 kcs jammer to permit interaction between their respective RF sections.

Since the location of the Voroshilov-Ussuriyskiy transmitter on 380 kcs has been verified in official Soviet publications, it is reasonable to assume that the jammer is located in that city.
